Exclusive Production of $\gamma\gamma \rightarrow \gamma Z$ Anomalous Coupling

Exclusive reactions $pp \rightarrow p + X + p$ can be studied by measuring X in a general purpose detector (CMS) and the scattered intact protons with forward proton detectors (PPS) located at ~ 210 m with respect to the main interaction vertex.

Proton Selection

- Two protons are selected from both sides of the CMS detector.
- $\xi_{PPS} = 1 - |P_z(\text{GenProton})|/7000$.
- ξ and protons measured times are smeared by a Gaussian distribution with a mean of 0 and a standard deviation of 0.02 to account for the related PPS timing detector uncertainties.
- PPS acceptance:
 - $0.0147 < \xi_{\text{vertical}} < 0.196$
 - $0.0472 < \xi_{\text{horizontal}} < 0.287$
- To mitigate PU, two protons with the smallest $|Z_{\text{Vertex, cms}} - Z_{\text{Vertex, PPS}}|$ are selected.
